1. Name*	Khizar Ahtisham
2. Category (Children or Youth)	Youth
3. Age as of June 15, 2020	21 Years
4. Gender	Male
5. Nationality	Pakistani
6. Address	Hazoori bagh road, Quaid e azam Street, Multan
7. E-mail	khizarahtisham@gmail.com
8. Phone number	0301-4867815
9. School name (if applicable)	
10. Essay title*	A LETTER FROM MYSELF IN 2030
11. Language	English
12. Word count (excluding this cover page)	701

My essay

As a world is growing nowadays everything has become changeable if we see hundred

years ago then there were no technology people lives simple life they do their works by

the hands they struggle to do or finish their work like if we take the examples of agriculture people seeds there lands by their self people watered there by their self people cut the crops of the lends by the self but if we see the structure nowadays now everything is changeable technology has changed the life patterns if today's we want to seed in the land then we do not have to waste our time to do it by our hands by our self or by our physical movement a man who have technology nowadays can use machineries and us the latest productive methods similarly we use same techniques for watering. Similarly, if you take the examples of communication, in early age the communications were difficult it takes a lot of time to deliver one message from one place to another place nowadays we are using mobiles and we communicate with one another in an instance of times in past when people communicate with one and other then it takes a lot of time it takes money and sometimes communications was unsuccessful but now it is by using technology we can communicate within an instance of time within the moment and our communication chances is always 99% successful we have saved our money from the technology we have save our time. Similarly, now with examples of artificial intelligence as mentions in example of the technology, communication and agriculture similarly nowadays the world is trying to convert everything in artificial intelligence like we are working on robotics working at data sciences we are working on the machine learning etc. In most of the experiments they become successful and in

some experiment, they are trying to be successful like we know just two types of artificial intelligence artificial narrow intelligence (ANI) and artificial general intelligence(AGI) nowadays all the successful inventions are in the field of ANI   artificial intelligence means we have developed the program that can only work on a single algorithm for our machine we are trying to make algorithms and reboots like humans, they can work like human and they can even think by their self. These things even working in a world best progressive country and the countries that are not progressive countries and even not aware of these things they are behind from the progressive country a hundred years. The society in which I live is in progressive stage means we are working on these things in some areas our people even don't know about these things and in some areas, people are also working on it and also working for the betterment of these things. According to the state of the world today due to COVID-19 everything changed it destroyed the everything it destroyed the speed of progress in all over the world is destroyed technology similarly world is working for these things like COVID-19 no one could aspect that these things would influence the word and disturb   everything. We can consider 2020 as black year that how it affects everything similarly, we can say 2030 may be best progressive year. We should keep it in mind there is 10 years of duration between 2020 to 2030 LIKE COVID-19 any other thing can also be happened, economic condition of the world can be different. By keeping the benefits and the

hazards of life in mind we should work accordingly. The message I want to give to the society is to work on technology for the better man of the society like I want to give an example of the 5G technology we started telecommunication from the GSM then we move to 2G, 2.5G, 3G and nowadays we are using 4G in telecommunications and technology 5G is almost about to launch but the disadvantage is that, its rays are dangerous for the flying animals, for the living animals even for the humans. The only message I want to give is to work on technology but be careful about the society that the technology you're introducing shouldn't affect society.
